About This Course
Conceptual Physics — The Full Version

Thank you for signing up for Conceptual Physics—Full Version. This article is much like a “users guide” to your Conceptual Academy course. It’s full of many details, which we hope will answer most of your questions.

1. About Conceptual Physics, Full Version

This course is divided into units, which are divided into lessons. Each lesson is designed to take about a week to complete with the assumption the student has other courses and extracurricular activities. For this course there are 41 lessons, which is ample for a full academic year of study. If few or no other courses are being taken, then this course could potentially be completed over a single semester. You'll note we don’t quite cover the entire textbook in this course. Chapter 31, for example is left out. If you find you need to pare down further, such as for a summer session, consider material from chapters 21, 25, 29, 30, and 36 as optional. Whether you cover this material or not should be based upon student interest level.

2. Laboratories

Science and experiments go together hand-in-glove. For this Conceptual Physics course there are four resources for these important hands-on activities:

1) You’ll find the “Think and Do” activities described right within the textbook end-of-chapter material. Yum!

2) We also offer “PhET Labs” that make use of computer simulations created through the PhET program sponsored by the University of Colorado. We have created write ups for 12 of these “dry labs” and they are included at no additional cost. Each write-up is provided within the Doc Share of the lesson to which it applies.

3) We highly recommend the Beyond the Laboratory Manual created by professor Stephanie Blake of Ozarks Technical College, MO, and edited by John Suchocki to match this Conceptual Physics self study course. This manual features 18 crafty, engaging, and mind-opening hands-on experiments using only household items or materials readily available from any discount store. Contrast this to lab kits costing hundreds of dollars. Any cost issue aside, these labs are of high quality as well as tightly
integrated into your course. Through our support site, LearnScience.Academy, the lab manual itself can be downloaded for free, but a $15 contribution is requested to support its further development.

4) You might also consider purchasing the *Conceptual Physics Lab Manual* by Dean Baird, especially if you have access to standard physics laboratory equipment, such as at a local high school. This manual, however, also contains some lab activities that can be implemented right within a home environment.

3. Learning Philosophy

We are strong proponents of “interleaving”, which means a student undertakes a series of shorter study sessions on different subjects rather than one long study session on a single subject. For example, the student might spend an hour studying physics, followed by a history lesson. Interestingly, as the student is then studying history, the physics lesson remains brewing at a deeper level—and vice versa with history as the student turns back to the physics.

We are also advocates of “Step 1/Step 2” learning. Step 1 is where the student is being introduced to material, such as through the textbook and video tutorials. Step 1 is an input process. You’ll note the mouth is closed. “Step 2” is an output process where the student tries to articulate (output) that which they think they learned from Step 1. Of these two steps, Step 2 is arguably the more difficult. Students tend to avoid Step 2 or neglect its importance. Learning, however, is only deep and durable when BOTH Step 1 and Step 2 have been employed. See our “How to Study Effectively” document to learn more.

4. A Typical Student Day

So what should a student’s typical day look like? We find it generally best for the student to begin with a Step 1 activity, such as reading the textbook or watching a video tutorial. After completing each textbook chapter section or video, the student is encouraged to ask themselves a most powerful learning question: “What did I just learn?” and then to answer this very question aloud or in writing. In doing so, the student is interleaving a Step 2 activity within a Step 1 activity, which is awesome.

After working with the textbook and videos (and then maybe some history), the student should put effort into the “Practice Page” worksheets available from the Doc share.

The “Next-Time Questions”, also available in select Doc Shares, make for a good family activity. Some one posts an NTQ (without the answer). It becomes a subject for discussion until the answer is revealed the next day.

There are the many end-of-chapter (EOC) questions within the textbook. These are an essential Step 2 activity for the student. Because of their great number, we recommend at least half of the odd-numbered questions be attempted. Notably, the student will find the answers to the odd-numbered questions at the back of the book. This is important for the student to be able to confirm their understanding. It’s also important that the student try
their best to answer the question BEFORE looking at the answer. Any good answer will “make sense” after reading it. But it’s NOT the answer that matters. What counts is being able to come up with the answer on one’s own. There’s a world of a difference between reading an answer and creating that answer yourself.

Of course, any opportunity the student has to summarize (aloud) what they believe they have learned to classmates, friends, or family members, is a serious bonus to the learning process—on many levels.

In addition to the above activities, there are the labs and the unit exams.

5. Grades—Summative and Formative

In traditional academics, most students are more focused on their letter grade than the actual learning that letter grade is suppose to represent. When scholarships and admissions to competitive schools are at stake, this is understandable. Ideally, though, a higher letter grade reflects higher learning. But there are all sorts of exceptions. A student who has struggled for a “C” in a subject that is of sincere interest, is more likely to retain that knowledge over the long term, than a book savvy student who could care less but can still pull an “A”.

We await the day when the standardized “Scholastic Aptitude Test” is replaced with a “Scholastic Attitude Test”. . In our experience as college professors, attitude is just as important as aptitude, if not more so.

It’s not until grad school that many students begin to realize that the whole A|B|C|D|F grade system itself is to be taken with a huge grain of salt. What counts most is the learning. But more than mere “knowledge” the ideal goal is nurturing our innate curiosity. Then beyond curiosity, and much more valuable than a perfect SAT score, is helping the student grow into a responsible, well-adjusted, happy, loving, and productive individual who can support him or herself and a family with a career they actually enjoy.

The true value of a grade is not as a final end-all to a particular course of study. Let’s call that a “summative grade”. Rather, grades are more important as feedback that helps us learn DURING that course of study. Let’s call this a “formative grade”. The value in a formative grade is in the guidance it provides while we still have time to make corrections—to let us know when we’re on track and when we might still be holding onto misconceptions BEFORE the end of the semester.

We here at Conceptual Academy are not in a position to assign a final overall summative grade for each student. We feel this is more the prerogative of the teacher who has been working directly with the student throughout the course of study. We are, however, very much in a position to provide formative grades throughout. This comes in the form of the reading and video quizzes as tracked by the Conceptual Academy grade book, as well as the answers to the EOC at the back of the book, and the answers to the Practice Pages and NTQs available within the Doc Share, as well as the answer keys we provide for all unit exams and lab activities. Let’s talk about these components one by one.
Reading and Video Quizzes

For context, you should understand how these quizzes are used at the college level. College students using Conceptual Academy are typically told they need to collect a certain number of CA quiz points by the end of the semester. How many points depends upon the needs of the course, where 400 is a typical number. For such a course, all students who acquire at least 400 points will earn a 100% on this assignment, which counts for about 15% of their total letter grade. In this scenario, students aren’t penalized for wrong answers. They just need to keep taking quizzes until they earn these 400 points, and there are about 800 points possible! We call this a “carrot approach” such that Conceptual Academy is there to reward students for good study habits. Yes, they can click answers randomly. But that won’t help them when it comes to their exams for which they are greatly penalized for their wrong answers (a “stick” approach).

So, in the college scenario, you’ve got one instructor with potentially 100+ students. For a home school self-study course where the student teacher ratio is closer to 1:1, then there’s opportunity to take it to the next level, which means paying closer attention to the actual percentage of correctly answered questions as reported in the Conceptual Academy grade book.

For college students (where students may be tempted to click randomly), we find the percentage of quiz questions answered correctly hovers around 60%. For home schools, we see it hovering closer to 90%. Thus, if your student is hovering around 90% on these reading and video check questions, which are relatively easy, then your student is doing quite well. Please consider this along with what we expect of our college students in assigning any final summative letter grade. And for that letter grade, if you need to assign one, the reading and video quizzes should comprise only a minor component, such as 15%.

End-of-Chapter Questions

Most of the questions at the back of each chapter are presented in the short answer format. But which ones should your student answer? Here’s a good rule of thumb: Every other odd-numbered question is relatively ambitious. You’ll note that the questions start out easy, then build in difficulty level. We feel the “Think and Explain” questions are of most value.

Now, “how” should your student answer these questions? Think of these questions as conversation starters. Ideally, the student has some one they can explain their thoughts to verbally. There’s a discussion that leads to an agreement. Only then is the answer looked up in the back of the book. The student might rate themselves as to the quality of their initial answer on a scale of 1 through 5. At that point most students would just move onto the next question. We have a better alternative: Now that the student has been exposed to the “real answer”, have them explain it again! (without looking at the answer). Then they rate again on a scale of 1 through 5. You’ll see
what’s happening here is the student is articulating. As this is done, there are pathways within the brain that are literally being built. Durable learning is occurring! It requires effort. No one is exempt. It can be tiring. What to do when the student gets exhausted and feels like a sponge with all the water squeezed out of it?? Why not some physical activity or even history?

So, you should see that all the end-of-chapter questions are quite the resource for Step 2 learning. But how to grade their performance on these questions? The answer is: don’t. Learning is still occurring. No grading please. But you might consider setting a goal for the number of questions worked upon. For example, 15 questions. Get through 15 questions and you’ll have earned yourself a sticker, or better yet, a chocolate bar. Ultimately, the student should recognized that working on these EOC questions is great preparation for the unit exam. But beyond that, learning is its own reward. If all students could be brought to this understanding, we believe the bulk of problems in our nation’s education system would melt away.

Practice Page Worksheets

These are pencil-pushing minds-on activities. In a way, they are similar to a lab experience, except it’s all on paper. Our goal in creating these Practice Pages is to provide an enjoyable venue through which the student can apply what they think they understand. Please note: It’s not like the student already understands something and then should be able to do the work sheet. It’s the other way around! The understanding evolves only when the student is working on the worksheet.

This is similar to the end-of-chapter questions. The student may ask: How can I answer these questions if I don’t first understand the material?? They have it backward. The real question is: How can you understand the material if you don’t first work on these questions? The understanding itself arises from working on the questions. After Step 1? After reading the book and watching the videos? The student may feel they still don’t really understand. That’s correct. That’s a wise student! An even wiser student knows that the understanding will grow like a seed from the soil only when watered by a stream of well-placed questions (Step 2). We call this “formative”.

Unit Exams

Our unit exams can be considered a blend of both formative and summative grading, but with an emphasis on the formative. They are each presented in what at first seems like an unusual and complicated format, we call the “pyramid” format. But once you’ve been introduced to this format, you’ll see it as a great learning opportunity. And fun too! You’ll never want an exam presented in any other manner.

You’ll find the pdf for each unit exam in the Doc Share on the last FYI page of each unit. Unlike the quizzes, and much like the Practice Pages, these are to be printed out. You’ll find each exam begins with directions on how to run the exam in the pyramid format. Keep in mind that this format requires relatively tough questions. Your
student is doing well upon earning around 60% on the first round! Make sure they understand this.

In assigning a final summative grade, performance on these unit exams should be weighted heavily. For college students, their exams typically account from 50% to 80% of their course grade (lecture component). This would include their final exam. We have not included a final exam in this course as we expect different students will be covering different material. But for a final exam, if you wish for such, it would be fair for you to collate 40 relevant questions from all the previous unit exams taken over the course. Use the very same questions. That’s legit and we would argue preferable.

Lab Activities

Many colleges still follow a 3:1 credit system, whereby the student earns 3 credit hours for “lecture” and 1 credit hour for “laboratory”. On some campuses the student earns a single grade for both lab/lecture. At other campuses, the grade for lecture and lab are recorded separately. So, one way or the other, the lab component counts for about 25% of the overall assessment. It is typical that a student’s lab scores tend to lift their lecture scores, which are based primarily on the mid-term exams as described above.

For your Conceptual Academy course, we recommend the same kind of balance. Ideally, the hands-on lab activities are there to complement the more minds-on process of learning concepts. The two work together. Relative to a grade, consider granting your student 75% just for completing an activity. You might then nit-pick the remaining 25% on the quality of a student’s writing or their answers to questions.

On a final note, the course concludes with a downloadable, high-resolution Certificate of Completion, pre-signed by us and awaiting the signature of the student’s mentor.

6. Putting It All Together

In addition to the textbook, our library of video lessons (integrated with the textbook), the automated quizzes, the Practice Pages, Next-Time Questions, the unit exams, you will also find study advice from the author on each FYI page, computer simulations, plus a number of Easter egg surprises spiced here and there. And for responsive technical support, you need only write to Support@ConceptualAcademy.com.

We know you will find this self-study course to be unusually rich not only in content but in flavor. Our goals go beyond imparting knowledge. We aim to nurture a life-long curiosity about this amazing natural world in which we are blessed to live. We know this to be an important path to becoming good stewards. Further, the rules of nature are what we all have in common and as this world gets smaller, a focus on what we have in common becomes all the more important. Further still, understanding science for what it
is, for what it can do, for what it can’t do, for how it, for better or worse, has impacted our daily lives, is critically important for any student in this modern age.

Thank you for your support of Conceptual Academy. We are so please and honored to be working with you.

Good science to you!

The Conceptual Academy Team
