

LESSON 11

Rounding to Hundreds

Multiple-Digit Addition with Regrouping

As always, add the units first. A student may become so proficient at adding multiple digit numbers that he can add from the left, but that method is not appropriate at this stage. For now, always add from right to left, or from smaller to larger. Remember that you add units to units, tens to tens, and hundreds to hundreds. Whenever you add two numbers, always add the same values. “To combine, you must be the same kind.” The examples show the same problems worked out with place value notation and regular notation. If you have lined paper I suggest you turn it sideways to help keep the values in the proper places.

Rounding and Estimating to Hundreds

When adding large numbers, encourage the student to estimate the answer first. We have learned how to round and estimate to the tens place. Now we will increase our understanding by rounding and estimating to the hundreds place.

When you round a number to the nearest multiple of 100, there will be a number in the hundreds place but only zeros in the tens and units places that are to the right of the hundreds place. When rounding, only look at the number to the immediate right of the place value being considered—in this case the tens place. This number determines whether to stay the same or be increased by one. I tell the students we call it rounding because the tens and units are going to be a “round” zero. When we round a number such as 653, we can see one reason why we recommend rounding 5s up instead of down. Although 650 is halfway between 600 and 700, all the other 650s (651, 652, and so on) are closer to 700. Rounding 5s upward makes sense because if there is another non-zero digit, the number will be closer to the higher number we could round to.

When comparing an estimated answer to the final answer, you sometimes see a fairly large difference. For example, 451 will round to 500, and 352 will round to 400. Adding $500 + 400$ gives 900, but $451 + 352$ is only 803. Remember that an estimate is not intended to be exact. The time to be concerned would be if the final answer were 8,000 or 80.

Example 1

Round 383 to the nearest hundreds place.

The first step is to find the two multiples of a hundred that are nearest to 383. The lower one is 300 and the higher one is 400 because 383 is between 300 and 400. If the student has trouble finding these numbers, begin by placing your finger over the 83, so that all you have is a 3 in the hundreds place, which is 300. Then add one more to the hundreds to find the 400. I often write the numbers 300 and 400 above the number 383 on both sides as in figure 1.

Figure 1

300 400
383

Look at the number in the tens place. Does it fall in 0 through 4 or in 5 through 9? Since it is an 8, it is in the latter group, which means we round up to the next number, which is 400. Rounded to the nearest hundred, 383 is 400.

Example 2

Round 547 to the nearest hundreds place.

500 600 1. Find the multiples of one hundred nearest to 547.

500 600 2. We know that 4 goes to the lower number, 547 500.

In examples 3 and 4, the estimates are to the right in parentheses.

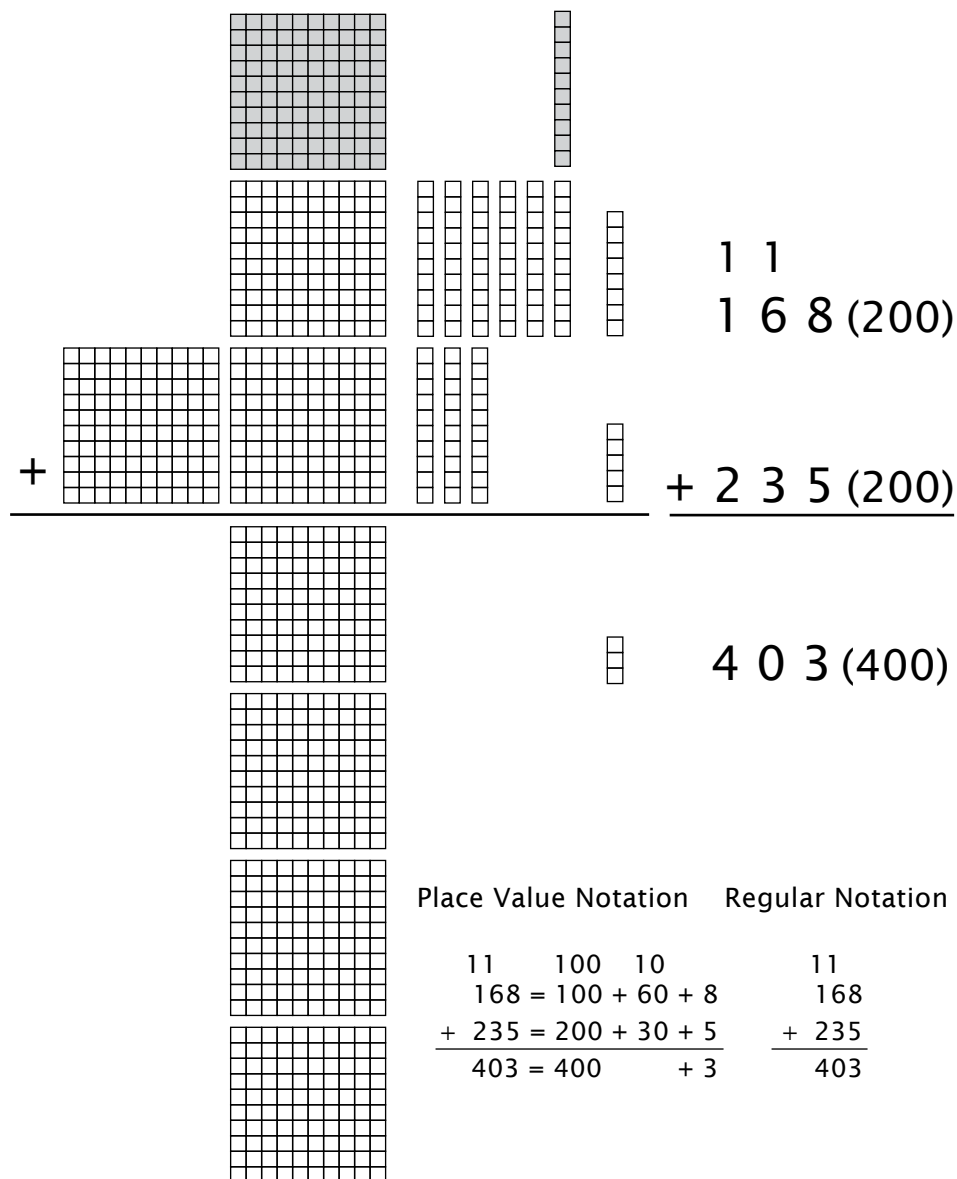

Example 3

Five units plus 8 units equals 13, which is 1 ten and 3 units. We move the ten (or carry it) to the tens place as indicated by the arrow. Then 6 tens plus 3 tens plus the 1 ten from the result of adding in the units place equals 1 hundred. The 1 hundred is moved to the hundreds place as shown. Example 3 is continued on the next page.

Example 3 (continued)

Adding all the hundreds gives us the answer of 4 hundreds, 0 tens, and 3 units or 403. The picture below shows the result after regrouping.

10. Rose went shopping. If she spent \$5.25 in one store and \$3.38 in another store, how much did she spend in all?

11. Chance had \$2.63 in his pocket. He got \$5.50 in a birthday card. How much money does he have now?

12. Joseph bought toys for his pug dog, Max. If he spent \$2.99 for a rubber bone and \$3.61 for a ball, how much did he spend in all?

LESSON PRACTICE

Add the money.

$$\begin{array}{r} 9. \quad \$2.87 \\ + \quad 6.89 \\ \hline \end{array}$$

10. Elizabeth found \$3.45 in her drawer and \$1.99 behind her dresser. How much money did she find in all?

11. Meredith wants to buy a book that costs \$5.55 and a box of crayons that costs \$2.15. How much money does she need?

12. Daniel's brother gave him \$6.34. His sister gave him \$2.95. How much money was Daniel given altogether?

LESSON PRACTICE

Add the money.

$$\begin{array}{r} 1. \quad \$2.13 \\ + 1.92 \\ \hline \end{array}$$

$$\begin{array}{r} 2. \quad \$4.71 \\ + 1.36 \\ \hline \end{array}$$

$$\begin{array}{r} 3. \quad \$6.41 \\ + .39 \\ \hline \end{array}$$

$$\begin{array}{r} 6. \quad \$7.35 \\ + 1.05 \\ \hline \end{array}$$

$$\begin{array}{r} 7. \quad \$1.63 \\ + .72 \\ \hline \end{array}$$

$$\begin{array}{r} 8. \quad \$4.99 \\ + 3.79 \\ \hline \end{array}$$

9. \$6.33
 + 2.91

10. Caleb lost \$5.10 yesterday and \$3.91 today. How much did he lose altogether?

11. Caleb found \$2.50 of his lost money (see #10). Timothy felt sorry for him and gave him \$4.50. How much money does Caleb have now?

12. Thomas has \$3.72 in his left pocket and \$3.68 in his right pocket. How much money does he have? Does he have enough to buy a toy that costs \$6.00?
